Contents

25m Flat irrigation hose

28 Tie straps 2.5mm x 100mm

24 Ground securing stakes

4 Tube / Tube connectors

10 Barb / Tube connectors

10 End stoppers

How to use

The irrigation hose can be cut to whatever length is required.

The length of hose then needs BOTH an End Stopper fitted, and a Barb / Tube connector (this connects to the main water feed tubing) for it to function.

Both are installed in the same way:

1. Open up the irrigation hose

2. Push the End Stopper or Barb Tube connector into the hose

3. Push right up to the flange on the connector and secure a tie-strap around

4. Pull tightly, trim if required

5. Barb / Tube connector can then be connected to the main water feed tubing

6. Completed fittings

How to use (continued)

Lay the length of irrigation hose on the ground as level as possible, following contours if necessary.

Use plastic stakes provided to fix in place.

Care should be taken not to damage the irrigation hose during cultivations. Scrape away any mulch covering before cultivation if necessary.

The hose can be left in position over the winter.

If required two lengths of hose can be connected using the Tube / Tube connector, same process as above.
